

## Work planned but not done/Further enhancements:

- Although the app has been deployed to AWS Elastic Beanstalk, the notification feature is not working properly due to some error. I think it requires another instance of an AWS worker to run in the background, but unable to implement it yet.  
URL: <http://durango.ap-south-1.elasticbeanstalk.com/>
- Modelling users interests and displaying related news could not be completed as it requires learning ML concepts and going through research papers (for interest modelling part), which is consuming a lot of time.

## Some information I'd like to add:

- Since we are using a free sms API, it faces a lot of traffic. As a result, messages sometimes are received with a time lag.
- For testing, please use the following account as I've already added multiple tasks and app password from this account :  
Username: theboredbandit  
Password: rty
- The Chat feature is very basic and works through socket creation. For now, we have a single chat room only (i.e., all clients receive the message simultaneously).
- Github link: <https://github.com/theboredbandit/Durango>
